INTRODUCTORY NOTES

In the face of urgent climate challenges, this report joins in on the call to action, recognizing the need for swift change.

Our purpose here is simple: transparency – an open look at our operations, our commitments and targets, and our progress. We believe that being transparent is a fundamental step towards responsible action, providing a clear picture to make informed decisions.

At SeenThis, our commitment is straightforward. We're working to minimize our operational footprint while maximizing our handprint – our positive contribution. Through our data-efficient streaming solutions, we aim to drive awareness, inspire action, and enable emissions reductions in the environmental impact of digital content consumption. This report reflects our journey, actively contributing to a more sustainable future while providing the necessary information for informed decision-making.

METHODOLOGY

Definitions

SeenThis refers to SeenThis AB.

GHG emissions refers to greenhouse gas emissions and includes the emissions of 7 greenhouse gasses defined by the Kyoto protocol (CO₂, CH₄, N₂O, HFCs, CFCs, SF₆, and NF₃), measured in scope 1, 2 and 3.

CO₂e refers to CO₂ equivalents and includes the 7 greenhouse gasses recounted as carbon dioxide equivalents.

Emissions factor refers to a value that represents the amount of GHG emissions produced per unit of activity or spend.

Reporting period

SeenThis' GHG emissions data covers the period from 1st January to 31st December for the reported year. The emissions are reported annually with updated data.

Scope and consolidation

Scope 1 and 2 includes emissions from all owned or leased assets within SeenThis' operational control. Scope 3 includes upstream and downstream GHG emissions outside of SeenThis' operational control.

Requirements

SeenThis follows the GHG Protocol Corporate Standard and Scope 2 Guidance and Greenhouse Gas Protocol Value Chain Scope 3 Accounting and Reporting Standard to estimate and report GHG emissions and will follow the guidelines for inventory recalculation. SeenThis will not use offsets or avoided emissions as progress toward achieving near-term targets.

Baseline and Recalculation Approach

At SeenThis, the GHG emissions baseline is established as of the year 2021. The baseline was recalculated in 2023 to reflect a significant change in the boundary of the calculation. The baseline serves as the reference point for measuring emissions reduction progress. SeenThis recalculates the baseline when necessary, considering:

- Material Changes: Significant changes to operations or emission sources.
- Data Improvement: Better data sources or methodologies.
- Regulatory Updates: Changes in reporting requirements.
- Best Practices: Periodic reviews to align with evolving standards.
- Recalculation Frequency: Baseline recalculation should be performed every 5 years or when there is a proportional effect on emissions exceeding 5% of total emissions.
- Documentation: Any recalculations made should be well-documented.

By this SeenThis aims to maintain the integrity of the emissions baseline while allowing for adjustments when necessary to accurately reflect changes in operational context and reporting requirements.

Scope 1

Scope 1 emissions consist of the direct emissions produced from SeenThis' operations. SeenThis measures scope 1 emissions from:

- Stationary combustion: emissions that result from the combustion of fossil fuels onsite to produce electricity, steam heat and power.
- Mobile combustion: emissions from fossil fuels that are combusted from owned or leased mobile sources from on-road and off-road vehicles or machinery.
- Fugitive emissions: emissions from leaks of GHG over the operational lifetime of in office fridges and air conditioning units.

SeenThis does not currently have any scope 1 emissions but will continuously assess if there are changes to the operation and monitor the use of fuels for scope 1 activity data (fuels from stationary and mobile combustion, and fugitive emissions) within its operational control.

Scope 2

Scope 2 emissions cover all indirect emissions produced from the purchased electricity and district heating from offices within SeenThis' operational control. The consumed electricity and district heating is converted and measured in CO₂e by applying the relevant emission factors for market-based and location-based approaches. SeenThis establishes and reports progress on its emission reduction targets based on market-based accounting for scope 2 emissions.

SeenThis only had operational control of its Swedish and Norwegian offices in 2022, and therefore these are the only offices included in this category. The energy consumption from other offices is included under scope 3 category 8 upstream leased assets.

Scope 2 - Electricity

The electricity consumption for the Swedish office was measured and reported on invoices from the electricity provider. The electricity consumption for the building was allocated based on surface rented compared to total surface of the building.

The electricity used in the Swedish office was 100% covered by carbon-free energy certificates. This was reported as 95% nuclear power and 5% hydropower, assuming a market-based emissions factor of 0,21 g CO₂e/kWh.

The emissions relating to the share of the electricity consumption of the building was reported separately by the landlord.

The Norwegian office moved in August 2022 and emissions are collected per office for the period of tenancy. The total electricity consumption for the current and former Norwegian offices were allocated using the same method as for the Swedish office for the respective rental periods. The electricity consumption for the current and former office buildings were allocated based on surface rented compared to total surface of each building.

The electricity used in the Norwegian offices was 100% covered by carbon-free energy certificates. This was reported as hydropower for the current Norwegian office, assuming a market-based emissions factor of 0,04 g CO₂e/kWh. As specific energy source was unknown for the former office, a more conservative emissions factor for wind power was assumed, 0,42 g CO₂e/kWh.

Emissions were calculated using country specific emission factors for the location-based approach for all offices.

Scope 2 - District Heating

The district heating and cooling of the Swedish office building was reported by the landlord and allocated based on surface rented compared to total surface of the building. Since the producer allocates all electricity consumption to the production of district heating, the cooling is regarded as a by-product, resulting in an emissions factor of 0 g CO₂e/kWh.

The district heating of the current Norwegian office building was reported by the landlord and allocated based on surface rented compared to total surface of the building. District heating data for the former Norwegian office was not available for 2022. Therefore, SeenThis has estimated consumption based on the data from the current Norwegian office using an intensity metric (kWh/month). District cooling data was not reported for either office but assumed negligible and therefore not included.

Emissions were calculated using supplier provided emission factors for both the market-based and location-based approaches for the office in Sweden and the current Norwegian office, assuming the same emission factor for both Norwegian offices.

Scope 3

Scope 3 covers all the material categories of the Greenhouse Gas Protocol and is measured in CO₂e. Of the 15 scope 3 categories in the Greenhouse Gas Protocol, only 8 are material to SeenThis.

The emission factors used to calculate GHG emissions from the material scope 3 categories are from the following datasets:

- BEIS 2022: emission conversion factors used by UK and international organisations to report on 2022 GHG emissions.
- EEA 2021: European emission factors for electricity.

- NVE 2022: Norwegian emissions factors for electricity.
- EPA 2022: US based emission factors for electricity.
- DCCEEW 2022: Australian emission factors for electricity.
- EMA 2021: Singaporean emission factors for electricity.
- DEFRA 2011: spend based emission factors which have been adjusted for inflation to reflect the economic contribution of the company more accurately in the reporting period. The emission factors have also been exchanged into the currency of the reported spend data using the average exchange rate for the reporting year.
- ICAO: methodology and database of ICAO Carbon Emissions Calculator to calculate the carbon dioxide emissions from air travel, accounting for various factors such as aircraft types, route-specific data, passenger load factors and cargo carried.
- SRI and Alliance Digitale Reference Framework for Calculating the Carbon Footprint of Digital Campaigns, v2 2023: consisting of a methodological reference framework (“SRIxAD framework”) and a database (“SRIxAD database”) of data and market averages to calculate the carbon impact of digital ad delivery.

Category 1 - Purchased Goods and Services

SeenThis has included spend based data in scope 3 category 1, replaced by supplier provided data where this has been reported to SeenThis. The spend based data has been reported from the financial department in a consolidated format, and therefore cannot be separated by office. Relevant spend based emission factors have been applied for each spend category.

Data related to transportation, including hosting and distribution of served impressions has been included in scope 3 category 4 upstream transportation and distribution, and data related to business travel has been included in scope 3 category 6 business travel.

Spend data were excluded related to suppliers of consulting services that are effectively salaries of consultants that are treated as FTEs for the purpose of this reporting, and impact included in other categories (leased offices, business travel, employee commuting, etc).

Category 3 - Fuel and energy related activities not included in scope 1 & 2

SeenThis has included all well-to-tank (WTT) emissions from upstream extraction, production, transportation, and distribution activities associated with fuel, electricity, heating, and cooling production not included in scope 1 and 2. SeenThis has also included transmission and distribution (T&D) losses associated with the transfer and distribution of the consumed energy.

Due to the lack of available country specific data, SeenThis has used UK emissions data sourced from BEIS 2022, which will likely have a higher emission factor than

WTT emissions from Sweden and Norway due to a higher fossil fuel mix in the electricity grid.

Category 4 - Upstream transportation and distribution

SeenThis has included spend based data in scope 3 category 4 from upstream transportation and distribution. The spend based data has been reported from the financial department in a consolidated format, and therefore cannot be separated by office. Relevant spend based emission factors have been applied for each spend category.

SeenThis has included supplier provided data in scope 3 category 4 from hosting and distribution related to served impressions. As the reported data related to data transfer through CDN servers does not include embodied emissions, the data transferred over the year is also multiplied with the emissions factor $1.86e-04$ kgCO₂e/GB, based on SRIxAD database values of manufacture and end-of-life of an average physical server server impact of 732 kg CO₂e per year and server output of 125,000 kB/s.

Category 6 - Business travel

SeenThis has included supplier provided data in scope 3 category 6 from business travel for air travel. The method used by the supplier (“the travel agency”) is the ICAO Carbon Emissions Calculator Methodology where emissions per passenger consider the load factor, are based only on passenger operations, and include complex and regularly updated databases on scheduled flights, passengers/cargo load factors and aircraft fuel burn. The following steps are taken to estimate emissions per passenger: estimation of the aircraft fuel burn; calculation of the passengers’ fuel burn based on a passenger/freight factor which is derived from RTK data; calculate occupied seats (assumption: all aircraft are entirely configured with economic seats) where seats occupied equals total seats times load factor; emissions per passenger equals passengers’ fuel burn times 3.16 divided by seats occupied. For flights longer than 3,000 km, emissions per passenger in premium cabin is assumed to be twice that of a passenger in economy. To also account for that gases are emitted to the atmosphere when flying at altitude, a Radiative Forcing Index (RFI) factor of 1.9, as proposed by BEIS, is applied. The emissions were only reported by the supplier for air travel per booking and were combined by location of the employee making the booking.

For business travel managed by the travel agency relating to hotel nights, only number of hotel nights per location was reported. The emissions were calculated using the by BEIS proposed Hotel Footprinting Tool, produced by the International Tourism Partnership and Greenview, which have been derived from the Cornell Hotel Sustainability Benchmarking Index that uses annual data from international hotel companies and a standardized industry methodology.

For business travel not managed by the travel agency, SeenThis has included all spend based data. The data has been reported from the financial department in a consolidated format, where it is only possible to separate spend for the offices in Sweden, Norway, the UK and the US. For the spend related to the Swedish office, but

not managed by the travel agency, 23% could be identified as related to taxi travel, and 17% related to public transport. The remaining spend was assumed to be distributed according to the data reported by the travel agency, showing a 52% of spend on air travel and 48% of spend on hotels. This distribution was assumed also for the spend related to the other offices. Relevant spend based emission factors have been applied for each spend category.

Category 7 - Employee commuting

SeenThis has included data in scope 3 category 7 from employee commuting, based on an employee survey. Annual GHG emissions were calculated based on km travelled assuming an average of 48 work weeks in a year, using BEIS 2022 emission factors for each FTE's mode of transport.

SeenThis has incorporated data on home office emissions. The calculation for home office emissions is based on the days when an employee indicated they do not commute to the office. It assumes a computer usage of 100W and a screen usage of 50W, active for 9 hours (reflecting an 8-hour workday with a 1-hour lunch break). This is then multiplied by 48 work weeks in a year and utilizes the average emission factor per location.

The average tCO₂e/FTE were extrapolated for the remaining FTEs that did not respond to the survey.

Category 8 - Upstream leased assets

The energy consumption from the offices in the US, the UK, France, and Denmark are included in this category, given that SeenThis does not have operational control of these sites.

For the US office in Connecticut, electricity consumption was reported by the landlord and allocated based on surface rented compared to total surface of the building.

Electricity data for the other offices was not available for 2022. Therefore, SeenThis has estimated consumption based on the data from Sweden using an intensity metric (kWh/FTE), given that the day-to-day operations within the company are similar. Emissions were calculated using country specific emission factors for electricity production.

District heating or cooling data for the other offices was not available for 2022. Therefore, SeenThis has estimated consumption based on the district heating data from Sweden using an intensity metric (kWh/FTE), given that the day-to-day operations within the company are similar. Emissions were calculated using country specific emission factors for electricity production. District cooling data was not reported for either office but assumed negligible and therefore not included.

SeenThis has included all well-to-tank (WTT) emissions from upstream extraction, production, transportation, and distribution activities associated with the consumed energy. SeenThis has also included transmission and distribution (T&D) losses

associated with the transfer and distribution of the consumed energy. Due to the lack of available country specific data, SeenThis has used UK emissions data sourced from BEIS 2022.

Category 9 - Downstream transportation and distribution

SeenThis acknowledges the emissions impact of energy-use and embodied emissions in downstream core network infrastructure and recognizes the importance of estimating this impact in a cradle-to-gate or cradle-to-grave life cycle analysis for digital products and services. However, recognizing SeenThis' limited short-term influence on the core infrastructure of the Internet, this additional reporting is done for transparency reasons and included solely for a comprehensive understanding of SeenThis' environmental impact. It should be explicitly clarified that these emissions are not considered in the setting or measurement of SeenThis' targets.

SeenThis estimates use and embodied emissions from network related to data transfer of served impressions. The data transferred over the year is multiplied with the emissions factor $1.86e-04$ kgCO₂e/GB, based on SRIxAD framework's network stage of the broadcast, using international database values, assuming global average electricity emissions factor (0.44 kgCO₂e/kWh), a set share of devices based on average SeenThis data (20% computer, 76% smartphone, 4% tablet), and network depending on device (mobile for smartphone, otherwise fixed), along with standard international values from the SRIxAD database.

Category 11 - Use of sold products

SeenThis acknowledges the emissions impact of data transfer and rendering on end-user devices and recognizes the importance of estimating this impact in a cradle-to-grave life cycle analysis for digital products and services. However, recognizing SeenThis' limited influence on the use of these devices, this additional reporting is done for transparency reasons and included solely for a comprehensive understanding of SeenThis' environmental impact. It should be explicitly clarified that these emissions are not considered in the setting or measurement of SeenThis' targets.

SeenThis estimates use and embodied emissions from end user device related to the view time of served impressions. The device stage of the broadcast model of the SRIxAD framework has been used, based on the same assumptions as for the other stages. The total impressions served during the year is multiplied with the average AVT for the year. For a static ad that does not have an inherent duration, a 1 second view time based on the MRC viewability standard is assumed.

Excluded categories and emissions

SeenThis has identified certain immaterial categories that are currently excluded from scope 3 emissions accounting. These categories include Cat 2 Capital goods, Cat 5 Waste generated from operations, Cat 8 Upstream leased assets, Cat 10 Processing of sold products, Cat 12 End-of-life treatment of use of sold products, Cat 13 Downstream leased assets, Cat 14 Franchises, and Cat 15 Investments. However, SeenThis is committed to a continual evaluation process to assess whether any of

these excluded categories should be reconsidered for inclusion in scope 3 reporting. This ongoing scrutiny ensures that the GHG accounting comprehensively reflects the environmental impact associated with SeenThis' activities and supply chain, allowing adaptation to evolving sustainability standards and best practices.

Programmatic advertising emissions

SeenThis considers the value chain of asset delivery from CDN server to end-user device, which excludes emissions from e.g., content production, ad space allocation & analytics, media distribution, and post-click. SeenThis acknowledges that these steps, although not part of the value chain of asset delivery and outside SeenThis control, would be relevant to evaluate within the value chain of programmatic advertising.

Non-product related data transfer emissions

SeenThis acknowledges the environmental impact of data transfer associated with its operations, going beyond its products, services, and served impressions. While a portion of these emissions would be included in the spend based data reported for certain IT service suppliers, no further estimations have been conducted to encompass potential additional emissions related to this aspect of our operations.

Advertised emissions

SeenThis acknowledges that advertising enabled through the SeenThis technology may result in increased sales of products and services, potentially leading to increased emissions. However, increased sales and related emissions impact are not reported to SeenThis from the clients. Moreover, the general correlation between increased advertising and increased sales is uncertain. Therefore, SeenThis will not include an estimate of the emissions resulting from increased advertising.

Employee pension emissions

SeenThis acknowledges that financial investments, including those related to employee pensions, may contribute to GHG emissions. Due to complexities and uncertainties, compounded by the individual investment choices made by employees, and the investments estimated negligible impact compared to overall emissions, SeenThis currently does not include estimates of pension-related emissions.

COMMITMENTS

Initiatives

Ad Net Zero

SeenThis is a proud supporter of Ad Net Zero, a coalition of leading advertisers committed to reduce the carbon impact of developing, producing, and running advertising to real net zero. Through Ad Net Zero's five-point Action Plan the advertising industry is guided on its transition to net zero.

The Science Based Targets initiative (SBTi)

Committed to ambitious climate action, SeenThis has validated its near-term target with the Science Based Targets initiative (SBTi). By setting and achieving science-based targets, SeenThis contributes to global efforts to limit global warming, ensuring our business practices are in harmony with a low-carbon future.

SME Climate Hub

SeenThis extends its commitment to the SME Climate Hub, where SeenThis has pledged to achieve net-zero before 2040. By joining this initiative, SeenThis champions climate action within small and medium-sized enterprises, recognizing their vital role in achieving a resilient and sustainable global economy.

Race to Zero

Through the SME Climate Hub, SeenThis joins the Race to Zero, a global campaign mobilizing businesses, cities, regions, and investors for rigorous and immediate climate action. SeenThis' commitment to net-zero emissions contributes to the collective effort to limit global temperature rise and build a more sustainable future.

CommToAct

SeenThis supports CommToAct, an initiative focused on fostering communication and collaboration for climate action. By engaging in meaningful dialogue and collective efforts, SeenThis works towards creating a positive impact on the climate and advancing a shared commitment to sustainability.

Targets

Near-term target

SeenThis commits through SBTi's SME pathway to reduce scope 1 and scope 2 GHG emissions by 42% by 2030, measured from a 2021 base year. Additionally, we commit to measuring and reducing scope 3 emissions.

Net-zero target

SeenThis commits to reaching net-zero by 2040. As part of this commitment, SeenThis pledges to reduce absolute scope 1, 2, and 3 GHG emissions by 90% by 2040, measured from a 2021 base year.

RESULTS

GHG inventory

Listed below is the summary of all emissions per site quantified in metric tonnes CO₂e.

	SCOPE 1	SCOPE 2 LOCATION BASED	SCOPE 2 MARKET BASED	SCOPE 3 UPSTREAM	SCOPE 3 DOWNSTREAM	TOTAL ¹
	t CO ₂ e	t CO ₂ e	t CO ₂ e	t CO ₂ e	t CO ₂ e	t CO ₂ e
TOTAL	-	3.14	1.67	1,115.74	4,789.37	5,906.78
Sweden ²	-	1.65	1.46	893.93	4,789.37	5,684.76
Norway	-	1.49	0.21	94.64	-	94.85
United States	-	-	-	42.51	-	42.51
United Kingdom	-	-	-	80.68	-	80.68
Australia	-	-	-	1.00	-	1.00
France	-	-	-	2.17	-	2.17
Denmark	-	-	-	0.23	-	0.23
Singapore	-	-	-	0.58	-	0.58

1. Total emissions are calculated with the market-based method.

2. Emissions not possible to separate by site are reported as Sweden.

REPORTING YEAR: 2022

NUMBER OF EMPLOYEES IN THE REPORTING YEAR: 99

Progress and mitigation

See comparison to the 2021 baseline in below table.

	SCOPE 1	SCOPE 2 MARKET BASED	SCOPE 3 UPSTREAM	SCOPE 3 DOWNSTREAM
	t CO ₂ e	t CO ₂ e	t CO ₂ e	t CO ₂ e
2021	-	3.09	973.72	2,997.63
2022	-	1.67	1,115.74	4,789.37
Progress against baseline	+/- 0	- 1.43	+ 142.02	+ 1,791.74
	+/- 0%	- 46%	+ 15%	+ 60%
	- 46%			
			+ 14%	
2030 target	- 42%		N/A	N/A
2040 target	- 90%			N/A ¹

1. Scope 3 downstream emissions are not per definition excluded from SeenThis' reduction targets, however the only downstream emissions material to SeenThis are voluntarily reported for transparency reasons and are excluded from targets

SeenThis acknowledges a negative trend in scope 3 emissions, primarily propelled by heightened travel compared to a period of reduced business travel amidst the global impact of COVID-19, along with increased expenditures on suppliers. This upward trajectory is related to the expansion of operations as a fast-growing company, and the continued reliance on spend-based emissions factors for many suppliers.

SeenThis is taking proactive steps to mitigate this:

Engaging with suppliers and clients

SeenThis will actively engage with both suppliers and clients to collaboratively reduce emissions. This involves assessing the environmental performance of key suppliers and initiating dialogues on emissions reduction strategies.

Balancing business travel impact

SeenThis will continuously evaluate the environmental impact of business travel, weighing its benefits against its carbon footprint.

Optimizing operational data handling

To minimize data waste and its associated energy consumption and carbon footprint, SeenThis will work to improve operational data handling practices.

Technological innovation for positive contribution

SeenThis is continuously working on advancing the data transfer efficiency in the SeenThis streaming technology. Which will minimize downstream emissions, as well as empower clients to further reduce their data waste, related energy, and emissions.

Enhancing data quality for scope 3 emissions

SeenThis will refine the data quality for scope 3 emissions, ensuring a more accurate and comprehensive measurement of environmental impact.
